Chapter 1

Groups

Definition 1.0.1. A law of composition is a map $S^2 \to S$.

Remark. We will use the notation ab for the elements of S obtained as $a, b \to ab$. This element is the product of a and b.

Definition 1.0.2. A group is a set G together with a law of composition that has the following three properties:

- 1. **Identity** There exists an element $1 \in G$ such that 1a = a1 = A for all $a \in G$.
- 2. Associativity (ab)c = a(bc) for all $a, b, c \in G$.
- 3. Inverse For any $a \in G$, there exists $a^{-1} \in G$ such that $aa^{-1} = a^{-1}a = 1$.

Definition 1.0.3. An **abelian group** is a group with a commutative law of composition. That is for any $a, b \in G$, ab = ba.

1.1 Inverses

Definition 1.1.1. A **left inverse** of $a \in S$ is an element $l \in S$ such that la = 1.

Definition 1.1.2. A right inverse of $a \in S$ is an element $r \in S$ such that ar = 1.

Proposition 1.1.1. If $a \in S$ has a left and right inverse $l, r \in S$ then l = r and are unique.

Proof. Immediately, $la=1,\ lar=r,\ l=r.$ Now, Let $a_1^{-1}, r_2^{-1} \in S$ both be inverse of $a \in S$ We have $a_1^{-1}a=1,\ a_1^{-1}aa_2^{-1}=a_2^{-1},\ a_1^{-1}=a_2^{-1}.$ □

Proposition 1.1.2. Inverses multiply in reverse order: $(ab)^{-1} = b^{-1}a^{-1}$.

Proof.

$$(ab)b^{-1}a^{-1} = a(bb^{-1})a^{-1} = aa^{-1} = 1$$

 $b^{-1}a^{-1}(ab) = b^{-1}(a^{-1}a)b = b^{-1}b = 1$

Proposition 1.1.3. Cancellation Law For $a, b, c \in G$ if ab = ac then b = c.

Proof.

$$ab = ac$$

$$a^{-1}ab = a^{-1}ac$$

$$b = c$$

Remark. Law of cancellation may not hold for non-invertible elements.

Proposition 1.1.4. Let S be a set with an associative law of composition and an identity. The subset of elements of S that are invertible forms a group.

Proof. (prove in homework) \Box

1.2 Symmetric Groups and Subgroups

Definition 1.2.1. A **Symmetric Group** denoted S_n is the set of unique bijections on the set $\{1, \ldots, n\}$. With function composition as the law of composition.

Remark. This is equivalent to the set of all permutations.

To denote the elements of a symmetric group we use a parentheses with element of the set $\{1, ..., n\}$ in the parentheses. Where the first elements maps the next one and the last element maps to the first one. Any elements not included map to themselves.

Example. Consider the elements $1, x, y \in S_n$ where 1 = (), y = (1, 2), and y = (1, 2, 3). Immediately we have

$$y^2 = 1$$

$$x^3 = 1$$

Through the cancellation law we find that the following elements are distinct and since $|S_n| = n!$ we have

$$S_3 = \{11, x, x^2, y, yx, yx^2\}$$

Definition 1.2.2. A group H is a **Subgroup** of G if H is subset of G, H has the same law of composition as G, and H is also a group. In other words H a group if it is a subset of G with the following properties:

- 1. Closure $a, b \in H$ then $ab \in H$.
- 2. Identity $1 \in H$.
- 3. Inverse For all $a \in H$, $a^{-1} \in H$.
